The Amazing World of the Atomites, Mollemites, and Alloymites.

Creation of Water

Introduction:

Scientists believe hydrogen was the first element to be formed in the universe. It is also believed that through nuclear fusion helium was formed. Nuclear fusion is the process in which a star crushes hydrogen to form this helium. This allows other various elements to be formed. Such as Carbon, Nitrogen, Oxygen, etc. It is apparent that the stars of our universe are some of the very first creators. Even when these stars die, it is said that the remaining heavier elements are formed. Such as Nickel, Iron, Gold, Silver, etc. No one can be for sure if all the elements were formed before any compounds or molecules were formed. One documented case of the first ever recordings of water's existence deals with an Atomite adventure. This is a tale of Oxygenmites vs. Hydrogenmites.

Oxygenmites normally war against metal Atomites. They simply just want to consume them, but Hydrogenmites are not metal Atomites. Hydrogen atoms have one electron the Hydromites use as a moon. However, this electron is often forms a positive ion giving it the metal appearance. This often causes the mistake of hydromites being metal atomite clans. This characteristic of hydrogen causes much study in the scientific community on Oxegon. The creation of water is a documented story of an Oxygenmite scientist who has studied hydromites and has come to the conclusion they can be used for some sinister plan. All the better since Hydromites couldn't be consumed by Oxygenmites.

Ozius was a mad scientist high in Oton-command. Arguably the most brilliant Oxygenmite to ever live. Ozius always wondered why hydromites and their world was so attractive but yet un-attractive. They weren't metals at all, but sometime appeared to be. This study was Ozius's deep hobby. He studied and already understood the Atomite function of combining with one another. Ozius had even studied Hydride. Two Hydromites forming with one another to form H₂. Hydride was Hydromeda's prominent hero.

Ozius: "Ahh!!! I figured you out Hydride. Yes indeed. You are a feisty little one. If I only could control..., but I can. Hmmm!!!"

Ozius pondered. He went to work on a sophisticated contraption. He slid back and forth between this contraption and some computer interface mechanism. He worked diligently on both devices.

Ozius: "He He He!! If I configure this, and adjust the variance. Hmm , Now! I just need to write the remote takeover program, and synchronize it with my PENAD. He! He! He! It is surely a work of mastery."

PENAD, or (Proton, Electron, Neutron, Acceleration, Device) This creation was believed to be the first to force bond elements to form not through natural occurrences.

Ozius: "Ah, If I program correctly, I should be able to remotely control...Yes Yes, I believe everything is set correctly. HMM! He He !!.. with this device," Ozius leans on his PENAD

"I can mergetwo or even more Atomites. My interface program should intergrate and allow me to control this newly morphed Atomite. He! He! He! I can create an army of mollemite soldiers at my command. HMM He! He! He !.....

Molecules! Two or more elements forming creating a new substance. This newly formed compound in the Atomite world was magnificent and thus is called mollemites.

After declaring everything was set to go, Ozius turned to his large monitor. It displayed a diagram of Hydride.

Ozius: “Yes, I have figured you out Hydride. I know everything about Hydrogen, you Hydromites are useful indeed. “

One of the first encounters of Oxygenmites vs. Hydromites was an assault gone bad. Oxygenmites were fooled and thought hydromeda was a metal home world and attacked. They quickly found out their AMP guns had a different effect on ydromites. It made them explosive. They burned and ignited. They were tuff to deal with, and also they were not consumable. It was a total disappointment. All orders were to avoid Hydromites. Ozius didn't get the memo. He knew he couldn't attack them by traditionall means, or a sanctioned attack until he proves their use.

Ozius: “I can't capture Hydride! He would be too tuff to deal with. Besides, he is already bonded , I need two Hydromites, Bond them, so I can interface the control mechanism. If my studies are correct, bond a fellow Oxygenmite. This should be a fierce fighter. I have to bond them simultaneously in my PENAD. This interface programming device should allow me to have full control. But...How am I gonna capture two Hydromites? “ Ozius scratched his head and pondered. “ Oton-command won't allow a sanctioned attack, to risky. So..I will have to think of something clever. Yes! I always do, so think Ozius. Think! I believe I will have to take this mission myself. I might just have to convinces them to come on a mission of importance, with me, to chancge atomic history. Hmm!”
